SUMMARY

Computer Science and Engineering graduate from Ahsanullah University of Science and Technology, seeking a junior .NET or software engineering role. Built two full-stack projects with REST APIs, JWT authentication, and relational databases, and solved 2,000+ competitive programming problems.

TECHNICAL SKILLS

- **Languages:** C#, C, C++, Java, Python, JavaScript, TypeScript, HTML, OOP
- **Backend:** .NET, ASP.NET Core Web API, RESTful APIs, Entity Framework Core, LINQ, JWT Authentication, Dependency Injection, Middleware, Async/Await
- **Frontend:** React.js, Next.js, Tailwind CSS, CSS
- **Databases:** PostgreSQL, MySQL, EF Core Migrations
- **Integrations:** Cloudinary API, SMTP, OTP verification
- **DevOps and Tools:** Docker, Git, GitHub, Postman
- **System Design:** Scalability, load balancing, caching, database replication and sharding, CDN, consistent hashing, rate limiting, distributed unique ID generation, message queues

COMPETITIVE PROGRAMMING

Solved 2,000+ coding problems across online judges.

Platforms: Codeforces (Pupil), CodeChef (3-star), LightOJ, LeetCode, Codeforces (practice ID)

Contests (certificates): ICPC Asia Dhaka Regional Contest 2025, MTB presents AUST Inter University Programming Contest 2025, BUBT Inter University Collaborative Programming Contest 2025

EDUCATION

- **Ahsanullah University of Science and Technology:** Computer Science and Engineering, CGPA 2.831
- **Sayed Afsar Ali Degree College:** GPA 5.00

PROJECTS

TradeHub: Social-Commerce Platform

Stack: ASP.NET Core Web API, Entity Framework Core, PostgreSQL, Next.js, TypeScript, Tailwind CSS, Cloudinary | Frontend | Backend

TradeHub is a full-stack social-commerce platform where users can create storefronts, organize products, promote them through social posts, and trade with other users. Buyers can place orders using cash-on-delivery or prepaid payment methods, while sellers manage inventory and accept or reject incoming orders.

- Implemented JWT authentication with rotating refresh tokens stored in httpOnly cookies.
- Built email verification with wrong-attempt limits, and used the Cloudinary API for image uploads.
- Built personal stores where users create categories and products with price, discount, stock quantity, and availability status, plus a social timeline with posts, a news feed, product recommendations, and a notification system.
- Built an order management system with views for all, pending, accepted, and rejected orders.

Problem solved: Built a dedicated social platform for online business where everyone is both a buyer and a seller, with proper product management, product recommendations, and order management through accept or reject.

DriveX: Multi-Company Car Rental Platform

Stack: React (Vite), ASP.NET Core Web API, Entity Framework Core, MySQL, JWT, Google OAuth2, Cloudinary, SMTP | Frontend | Backend

DriveX is a full-stack car-rental platform that enables multiple rental companies to manage and rent out their vehicles. Users book cars, company staff hand them over and start the rental timer, triggering an email confirmation. When users return the cars, staff submit them, apply any applicable late-return fine, and send a return-confirmation email.

- Built role-based access control with JWT and Google OAuth2 login. Used Cloudinary API, SMTP, and OTP verification.
- Built car filtering. Tracked users' active orders inside the user profile, with a proper booking history.
- Built separate UIs for different roles. Provided receipts and emails for proper accountability.
- Started the rental time when staff hand over the car to the user, triggering automated emails, so the rental time starts at handover, not when the user ordered.
- Ended the rental time when the user hands the car back and company staff submit it, triggering an email notification.
- Built admin management of cars and companies.

Problem solved: Solves unfair rental billing by starting the timer at handover, adds accountability, and brings multiple companies' cars into one easy online booking platform.
